angiosperms, which prevent self-fertilization and thus encourage outcross and allogamy. It should not be confused with genetically controlled physical or temporal mechanisms that prevent self-pollination, such as heterostyly and sequential hermaphroditism. In plants with SI, when a pollen grain produced in a plant reaches a stigma of the same plant or another plant with a matching allele or genotype, the process of pollen g

## *Self-incompatibility in Flowering Plants: Evolution ...*

Self incompatibility is one of the most efficient out breeding mechanism. Self incompatibility has been envisaged as one of the main cause for the rapid evolution of angiosperms. Even though cross pollination involves a great deal of pollen wastage because of its uncertainty more than 50% of the flowering plants are self incompatible. The flowering plants undergo this complex interaction because the self incompatibility results in genetic

## *Self Incompatibility in Flowering Plants*

Self-incompatibility is a widespread mechanism in flowering plants that prevents inbreeding and promotes outcrossing. The self-incompatibility response is genetically controlled by one or more multi-allelic loci, and relies on a series of complex cellular interactions between the self-incompatible pollen and pistil.

## *Mechanisms of self-incompatibility in flowering plants*

In self-incompatible plants, only pollen grains with S alleles not matching those present in the pistil are able to fertilize an ovule. genome of self-incompatible *P. inflata* plants and a self-compatible *Nicotiana* hybrid by *Agrobacterium*-mediated

*Self-incompatibility in flowering plants -  
ScienceDirect*

Self-incompatibility (SI) of flowers is a common theme among plants with about 50% of plant species being afflicted. Self-incompatible plants are not able to produce seeds when its flowers are pollinated from its own flowers or flowers from plants that are genetically the same.

*Flower Self-incompatibility | ICPS*

Great progress has been made in our understanding of pollen-pistil interactions and self-incompatibility (SI) in flowering plants in the last few decades. This book covers a broad spectrum of research into SI, with accounts by internationally renowned scientists. It comprises two sections:

Sexual reproduction in many flowering plants involves self-incompatibility (SI), which is one of the most important systems to prevent inbreeding. In many species, the self-/nonself-recognition of SI is controlled by a single polymorphic locus, the S -locus.

*Annual Review of Plant Diversity*

System of Self-Incompatibility in Flowering Plant: Heteromorphic and Homomorphic System! Incompatibility is the inability of functional male and female gametes to effect fertilization in particular combinations. Incompatibility is the integral part of pollen pistil interaction.

## *System of Self-Incompatibility in Flowering Plant ...*

Several mechanisms enable the stigma to discriminate between the different types of pollen that it may receive, of which the best studied is self-incompatibility. The molecules that regulate self-incompatibility are well characterized in two plant families, the Solanaceae and Brassicaceae.

## *SELF-INCOMPATIBILITY IN PLANTS*

*| Annual Review of Plant ...*

Self-incompatibility or intraspecific incompatibility is a well-designed genetic mechanism by which certain plants recognize and reject their own pollen thus forcing outbreeding. It is defined as “inability of the plant producing functional gametes to set seed upon self-pollination”,.
