The finite-element shape functions have finite support; in particular, the function is nonzero only in the vicinity of node j and varies linearly between one (at node j) and zero (at nodes i and k). Furthermore, the shape functions satisfy the "interpolation condition", where δ_{ij} is the Kronecker delta.

oomph-lib: The Finite Element Method

The finite element method (FEM) is used to compute such approximations. Take, for example, a function u that may be the dependent variable in a PDE (i.e., temperature, electric potential, pressure, etc.) The function u can be approximated by a function u_h using linear combinations of basis functions according to the following expressions: (1)

Detailed Explanation of the Finite Element Method (FEM)

The two volumes of this book cover most of the theoretical and computational aspects of the linear static analysis of structures with the Finite Element Method (FEM). The content of the book is based on the lecture notes of a basic course on Structural Analysis with the FEM taught by the author at the Technical University of Catalonia (UPC) in Barcelona, Spain for the last 30 years.
