Triple Negative Me Fe The Beginning

Triple-negative breast cancer (TNBC) accounts for about 10-15% of all breast cancers. The term triple-negative breast cancer refers to the fact that the cancer cells don ' t have estrogen or progesterone receptors and also don ' t make too much of the protein called HER2. (The cells test "negative" on all 3 tests.)

Triple Negative Me Fe The Beginning [DOC]

Triple negative breast cancer is a less common type of breast cancer. It develops in about 1 in 5 women with breast cancer (15 to 20%). It is more common in women under 40. It also seems to be more common in black women. We need further research to understand this more. But triple negative breast cancer can develop in women of any age and ethnicity.

Triple negative breast cancer - Macmillan Cancer Support

Read PDF Triple Negative Me Fe The Beginning

Triple-negative breast cancer is considered to be more aggressive and have a poorer prognosis than other types of breast cancer, mainly because there are fewer targeted medicines that treat triple-negative breast cancer. Studies have shown that triple-negative breast cancer is more likely to spread beyond the breast and more likely to recur (come back) after treatment.

Triple-Negative Breast Cancer: Overview, Treatment, and More

What Is Triple-Negative Breast Cancer? Triple-negative breast cancer is a kind of breast cancer that does not have any of the receptors that are commonly found in breast cancer.. Think of cancer cells as a house. The front door may have three kinds of locks, called receptors—.
